

# DS90UB913Q/DS90UB914Q 10-100MHz 10/12- Bit DC-Balanced FPD-Link III Serializer and Deserializer with Bidirectional Control Channel

Check for Samples: [DS90UB913Q](#), [DS90UB914Q](#)

## FEATURES

- 10 MHz to 100 MHz Input Pixel Clock Support
- Single Differential Pair Interconnect
- Programmable Data Payload:
  - 10-bit Payload up to 100 Mhz
  - 12-bit Payload up to 75 MHz
- Continuous Low Latency Bidirectional Control Interface Channel with I<sup>2</sup>C support @400 kHz
- 2:1 Multiplexer to Choose Between Two Input Imagers
- Embedded Clock With DC Balanced Coding to Support AC-Coupled Interconnects
- Capable of Driving up to 25 Meters Shielded Twisted-pair
- Receive Equalizer Automatically Adapts for Changes in Cable Loss
- 4 Dedicated General Purpose Input (GPI)/ Output (GPO)
- LOCK Output Reporting Pin and AT-SPEED BIST Diagnosis Feature to Validate Link Integrity
- 1.8V, 2.8V or 3.3V Compatible Parallel Inputs on Serializer
- Single Power Supply at 1.8V
- ISO 10605 and IEC 61000-4-2 ESD Compliant
- Automotive Grade Product: AEC-Q100 Grade 2 Qualified
- Temperature Range –40°C to +105°C
- Small Serializer Footprint (5mm x 5mm)
- EMI/EMC Mitigation - Deserializer
  - Programmable Spread Spectrum (SSCG) Outputs.
  - Receiver Staggered Outputs

## DESCRIPTION

The DS90UB913Q/DS90UB914Q chipset offers a FPD-Link III interface with a high-speed forward channel and a bidirectional control channel for data transmission over a single differential pair. The DS90UB913Q/914Q chipsets incorporate differential signaling on both the high-speed forward channel and bidirectional control channel data paths. The Serializer/ Deserializer pair is targeted for connections between imagers and video processors in an ECU (Electronic Control Unit). This chipset is ideally suited for driving video data requiring up to 12-bit pixel depth plus two synchronization signals along with bidirectional control channel bus.

There is a multiplexer at the Deserializer to choose between two input imagers. The Deserializer can have only one active input imager. The primary video transport converts 10/12 bit data over a single high-speed serial stream, along with a separate low latency bidirectional control channel transport that accepts control information from an I2C port and is independent of video blanking period.

Using TI's embedded clock technology allows transparent full-duplex communication over a single differential pair, carrying asymmetrical bidirectional control channel information in both directions. This single serial stream simplifies transferring a wide data bus over PCB traces and cable by eliminating the skew problems between parallel data and clock paths. This significantly saves system cost by narrowing data paths that in turn reduce PCB layers, cable width, and connector size and pins. In addition, the Deserializer inputs provide adaptive equalization to compensate for loss from the media over longer distances. Internal DC balanced encoding/decoding is used to support AC-Coupled interconnects. The Serializer is offered in a 32-pin WQFN package and the Deserializer is offered in a 48-pin WQFN package.

## APPLICATIONS

- Front or Rear View Camera for Collision Mitigation
- Surround View for Parking Assistance

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

**Serializer - DS90UB913Q — Top View**
**DS90UB913Q SERIALIZER PIN DESCRIPTIONS**

Pin Name	Pin No.	I/O, Type	Description
<b>LVCMOS PARALLEL INTERFACE</b>			
DIN[0:11]	19,20,21,22, 23,24,26,27, 29,30,31,32	Inputs, LVCMOS w/ pull down	Parallel Data Inputs.
HSYNC	1	Inputs, LVCMOS w/ pull down	Horizontal SYNC Input
VSYNC	2	Inputs, LVCMOS w/ pull down	Vertical SYNC Input
PCLK	3	Input, LVCMOS w/ pull down	Pixel Clock Input Pin. Strobe edge set by TRFB control register.
<b>GENERAL PURPOSE OUTPUT (GPO)</b>			
GPO[1:0]	16,15	Output, LVCMOS	General-purpose output pins can be configured as outputs; used to control and respond to various commands. GPO[0:1] can be configured to be the outputs for input signals coming from GPIO[0:1] pins on the Deserializer or can be configured to be outputs of the local register on the Serializer.
GPO[2]/CLKOUT	17	Output, LVCMOS	GPO2 pin can be configured to be the output for input signal coming from the GPIO2 pin on the Deserializer or can be configured to be the output of the local register on the Serializer. It can also be configured to be the output clock pin when the DS90UB913Q device is used in the External Oscillator mode. See <a href="#">Applications Information</a> for a detailed description of the DS90UB913/914Q chipsets working with the external oscillator.

**DS90UB913Q SERIALIZER PIN DESCRIPTIONS (continued)**

Pin Name	Pin No.	I/O, Type	Description
GPO[3]/CLKIN	18	Input/Output, LVCMOS	GPO3 can be configured to be the output for input signals coming from the GPIO3 pin on the Deserializer or can be configured to be the output of the local register setting on the Serializer. It can also be configured to be the input clock pin when the DS90UB913Q Serializer is working with an external oscillator. See <a href="#">Applications Information</a> section for a detailed description of the DS90UB913/914Q chipsets working with an external oscillator.
<b>BIDIRECTIONAL CONTROL BUS - I<sup>2</sup>C COMPATIBLE</b>			
SCL	4	Input/Output, Open Drain	Clock line for the bidirectional control bus communication SCL requires an external pull-up resistor to V <sub>DDIO</sub> .
SDA	5	Input/Output, Open Drain	Data line for the bidirectional control bus communication SDA requires an external pull-up resistor to V <sub>DDIO</sub> .
MODE	8	Input, LVCMOS w/ pull down	<b>Device mode select</b> Resistor to Ground and 10 kΩ pull-up to 1.8V rail. MODE pin on the Serializer can be used to select whether the system is running off the PCLK from the imager or an external oscillator. See details in <a href="#">Table 5</a>
ID[x]	6	Input, analog	<b>Device ID Address Select</b> The ID[x] pin on the Serializer is used to assign the I2C device address. Resistor to Ground and 10 kΩ pull-up to 1.8V rail. See <a href="#">Table 7</a>
<b>CONTROL AND CONFIGURATION</b>			
PDB	9	Input, LVCMOS w/ pull down	<b>Power down Mode Input Pin.</b> PDB = H, Serializer is enabled and is ON. PDB = L, Serializer is in Power Down mode. When the Serializer is in Power Down, the PLL is shutdown, and IDD is minimized. Programmed control register data are NOT retained and reset to default values
RES	7	Input, LVCMOS w/ pull down	Reserved. <b>This pin MUST be tied LOW.</b>
<b>FPD-Link III INTERFACE</b>			
DOUT+	13	Input/Output, CML	Non-inverting differential output, bidirectional control channel input. The interconnect must be AC Coupled with a 100 nF capacitor.
DOUT-	12	Input/Output, CML	Inverting differential output, bidirectional control channel input. The interconnect must be AC Coupled with a 100 nF capacitor.
<b>POWER AND GROUND</b>			
VDDPLL	10	Power, Analog	PLL Power, 1.8V ±5%
VDDT	11	Power, Analog	Tx Analog Power, 1.8V ±5%
VDDCML	14	Power, Analog	CML & Bidirectional Channel Driver Power, 1.8V ±5%
VDDD	28	Power, Digital	Digital Power, 1.8V ±5%
VDDIO	25	Power, Digital	Power for I/O stage. The single-ended inputs and SDA, SCL are powered from V <sub>DDIO</sub> . V <sub>DDIO</sub> can be connected to a 1.8V ±5% or 2.8±10% or 3.3V ±10%
VSS	DAP	Ground, DAP	DAP must be grounded. DAP is the large metal contact at the bottom side, located at the center of the WQFN package. Connected to the ground plane (GND) with at least 9 vias.

**Deserializer - DS90UB914Q — Top View**

### DS90UB914Q Deserializer Pin Descriptions

Pin Name	Pin No.	I/O, Type	Description
<b>LVC MOS PARALLEL INTERFACE</b>			
ROUT[11:0]	11,12,13,14,15,16,18,19,21,22,23,24	Outputs, LVC MOS	Parallel Data Outputs.
HSYNC	10	Output, LVC MOS	Horizontal SYNC Output.
VSYNC	9	Output, LVC MOS	Vertical SYNC Output.
PCLK	8	Output, LVC MOS	Pixel Clock Output Pin. Strobe edge set by RRF B control register.
<b>GENERAL PURPOSE INPUT/OUTPUT (GPIO)</b>			
GPIO[1:0]	27,28	Digital Input/Output, LVC MOS	General-purpose input/output pins can be used to control and respond to various commands. They may be configured to be the input signals for the corresponding GPOs on the serializer or they may be configured to be outputs to follow local register settings.
GPIO[3:2]	25,26	Digital Input/Output LVC MOS	General purpose input/output pins GPO[2:3] can be configured to be input signals for GPOs on the Serializer. In addition they can also be configured to be outputs to follow the local register settings. When the SerDes chipsets are working with an external oscillator, these pins can be configured only to be outputs to follow the local register settings.
<b>BIDIRECTIONAL CONTROL BUS - I<sup>2</sup>C COMPATIBLE</b>			
SCL	2	Input/Output, Open Drain	Clock line for the bidirectional control bus communication SCL requires an external pull-up resistor to V <sub>DDIO</sub> .
SDA	1	Input/Output, Open Drain	Data line for bidirectional control bus communication SDA requires an external pull-up resistor to V <sub>DDIO</sub> .

**DS90UB914Q Deserializer Pin Descriptions (continued)**

Pin Name	Pin No.	I/O, Type	Description
MODE	37	Input, LVCMOS w/ pull up	<b>Device mode select pin</b> Resistor to Ground and 10 kΩ pull-up to 1.8V rail. The MODE pin on the Deserializer can be used to configure the Serializer and Deserializer to work in different input PCLK range. See details in <a href="#">Table 2</a> . <b>12-bit low frequency mode – (10- 50 MHz operation):</b> In this mode, the Serializer and Deserializer can accept up to 12 bits DATA+2 SYNC. Input PCLK range is from 10MHz to 50MHz. <b>12-bit high frequency mode – (15-75 MHz operation):</b> In this mode, the Serializer and Deserializer can accept up to 12 bits DATA + 2 SYNC. Input PCLK range is from 15MHz to 75MHz. <b>10-bit mode– (20–100 MHz operation):</b> In this mode, the Serializer and Deserializer can accept up to 10 bits DATA + 2 SYNC. Input PCLK frequency can range from 20 MHz to 100MHz. Please refer to <a href="#">Table 6</a> in the <a href="#">Applications Information</a> section on how to configure the MODE pin on the Deserializer.
IDx[0:1]	35,34	Input, analog	The IDx[0] and IDx[1] pins on the Deserializer are used to assign the I2C device address. Resistor to Ground and 10 kΩ pull-up to 1.8V rail. See <a href="#">Table 8</a> Input pin to select the Slave Device Address. Input is connect to external resistor divider to set programmable Device ID address
<b>CONTROL AND CONFIGURATION</b>			
PDB	30	Input, LVCMOS w/ pull down	<b>Power down Mode Input Pin.</b> PDB = H, Deserializer is enabled and is ON. PDB = L, Deserializer is in Sleep (power down mode). When the Deserializer is in Sleep, programmed control register data are NOT retained and reset to default values.
LOCK	48	Output, LVCMOS	<b>LOCK Status Output Pin.</b> LOCK = H, PLL is Locked, outputs are active LOCK = L, PLL is unlocked, ROUT and PCLK output states are controlled by OSS_SEL control register. May be used as Link Status.
BISTEN	6	Input LVCMOS w/ pulldown	<b>BIST Enable pin</b> <b>BISTEN=H</b> , BIST Mode Enabled <b>BISTEN=L</b> , BIST Mode is disabled
PASS	47	Output, LVCOMS	<b>PASS Output Pin for BIST mode.</b> <b>PASS = H</b> , ERROR FREE Transmission <b>PASS = L</b> , one or more errors were detected in the received payload. See <a href="#">Built In Self Test</a> section for more information. Leave Open if unused. Route to test point (pad) recommended.
OEN	5	Input LVCMOS w/ pulldown	Output Enable Input Refer to <a href="#">Table 9</a>
OSS_SEL	4	Input LVCMOS w/ pulldown	Output Sleep State Select Pin Refer to <a href="#">Table 9</a>
SEL	46	Input LVCMOS w/ pulldown	MUX Select line <b>SEL = L</b> , RIN0+/- input. This selects input A as the active channel on the Deserializer. <b>SEL = H</b> , RIN1+/- input. This selects input B as the active channel on the Deserializer.
<b>FPD–Link III INTERFACE</b>			
RIN0+	41	Input/Output, CML	Non-Inverting Differential input, bidirectional control channel. The IO must be AC coupled with a 100 nF capacitor
RIN0-	42	Input/Output, CML	Inverting Differential input, bidirectional control channel. The IO must be AC coupled with a 100 nF capacitor
RIN1+	32	Input/Output, CML	Non-Inverting Differential input, bidirectional control channel. The IO must be AC coupled with a 100 nF capacitor
RIN1-	33	Input/Output, CML	Inverting Differential input, bidirectional control channel. The IO must be AC coupled with a 100 nF capacitor
RES	43,44	—	Reserved. <b>This pin must always be tied low</b>
CMLOUTP/N	38,39		Route to test point or leave open if unused
<b>POWER AND GROUND</b>			
VDDIO1/2/3	29, 20, 7	Power, Digital	LVCMOS I/O Buffer Power, The single-ended outputs and control input are powered from V <sub>DDIO</sub> . V <sub>DDIO</sub> can be connected to a 1.8V ±5% or 3.3V ±10%

**DS90UB914Q Deserializer Pin Descriptions (continued)**

Pin Name	Pin No.	I/O, Type	Description
VDDD	17	Power, Digital	Digital Core Power, 1.8V $\pm$ 5%
VDDSSCG	3	Power, Analog	SSCG PLL Power, 1.8V $\pm$ 5%
VDDR	36	Power, Analog	Rx Analog Power, 1.8V $\pm$ 5%
VDDCML0/1	40,31	Power, Analog	CML and Bidirectional control channel Drive Power, 1.8V $\pm$ 5%
VDDPLL	45	Power, Analog	PLL Power, 1.8V $\pm$ 5%
VSS	DAP	Ground, DAP	DAP must be grounded. DAP is the large metal contact at the bottom side, located at the center of the WQFN package. Connected to the ground plane (GND) with at least 16 vias.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

**Absolute Maximum Ratings<sup>(1)(2)</sup>**

Supply Voltage – $V_{DDn}$ (1.8V)		–0.3V to +2.5V
Supply Voltage – $V_{DDIO}$		–0.3V to +4.0V
LVCMOS Input Voltage I/O Voltage		–0.3V to + ( $V_{DDIO} + 0.3V$ )
CML Driver I/O Voltage ( $V_{DD}$ )		–0.3V to + ( $V_{DD} + 0.3V$ )
CML Receiver I/O Voltage ( $V_{DD}$ )		–0.3V to ( $V_{DD} + 0.3V$ )
Junction Temperature		+150°C
Storage Temperature		–65°C to +150°C
Maximum Package Power Dissipation Capacity Package		$1/\theta_{JA}$ °C/W above +25°
Package Derating: DS90UB913Q 32 Lead WQFN	$\theta_{JA}$ (based on 16 thermal vias)	38.4 °C/W
	$\theta_{JC}$ (based on 16 thermal vias)	6.9 °C/W
DS90UB914Q 48 Lead WQFN	$\theta_{JA}$ (based on 16 thermal vias)	26.9 °C/W
	$\theta_{JC}$ (based on 16 thermal vias)	4.4 °C/W
ESD Rating (IEC 61000-4-2)		$R_D = 330\Omega$ , $C_S = 150pF$
Air Discharge (DOUT+, DOUT-, RIN+, RIN-)		$\geq \pm 25$ kV
Contact Discharge (DOUT+, DOUT-, RIN+, RIN-)		$\geq \pm 7$ kV
ESD Rating (ISO10605)		$R_D = 330\Omega$ , $C_S = 150/330pF$
ESD Rating (ISO10605)		$R_D = 2K\Omega$ , $C_S = 150/330pF$
Air Discharge (DOUT+, DOUT-, RIN+, RIN-)		$\geq \pm 15$ kV
Contact Discharge (DOUT+, DOUT-, RIN+, RIN-)		$\geq \pm 8$ kV
ESD Rating (HBM)		$\geq \pm 8$ kV
ESD Rating (CDM)		$\geq \pm 1$ kV
ESD Rating (MM)		$\geq \pm 250$ V

For soldering specifications: see product folder at [www.ti.com](http://www.ti.com) and [www.ti.com/lit/an/snoa549c/snoa549c.pdf](http://www.ti.com/lit/an/snoa549c/snoa549c.pdf)

- (1) "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Recommended Operating Conditions is not implied. The Recommended Operating Conditions indicate conditions at which the device is functional; the device should not be operated beyond such conditions.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/ Distributors for availability and specifications.

## Recommended Operating Conditions

		Min	Nom	Max	Units
Supply Voltage ( $V_{DDn}$ )		1.71	1.8	1.89	V
LVC MOS Supply Voltage ( $V_{DDIO}$ ) OR		1.71	1.8	1.89	V
LVC MOS Supply Voltage ( $V_{DDIO}$ ) OR		3.0	3.3	3.6	V
LVC MOS Supply Voltage ( $V_{DDIO}$ ) Only Serializer		2.52	2.8	3.08	V
Supply Noise <sup>(1)</sup>	$V_{DDn}$ (1.8V)			25	mVp-p
	$V_{DDIO}$ (1.8V)			25	mVp-p
	$V_{DDIO}$ (3.3V)			50	mVp-p
Operating Free Air Temperature ( $T_A$ )		-40	+25	+105	°C
PCLK Clock Frequency		10		100	MHz

- (1) Supply noise testing was done with minimum capacitors (as shown on [Figure 44](#) [Figure 46](#)) on the PCB. A sinusoidal signal is AC coupled to the  $V_{DDn}$  (1.8V) supply with amplitude = 25 mVp-p measured at the device  $V_{DDn}$  pins. Bit error rate testing of input to the Ser and output of the Des with 10 meter cable shows no error when the noise frequency on the Ser is less than 1 MHz. The Des on the other hand shows no error when the noise frequency is less than 750 kHz.

## Electrical Characteristics<sup>(1)(2)(3)</sup>

Over recommended operating supply and temperature ranges unless otherwise specified.

$t_{JIT1}$	PCLK Input Jitter (External Oscillator mode)	Refer to Jitter freq>f/40	$f=10-100M$ Hz		1T		ns
$t_{JIT2}$	External Oscillator Jitter				0.1		UI

(1) Recommended Input Timing Requirements are input specifications and not tested in production.

## Serializer Switching Characteristics

Over recommended operating supply and temperature ranges unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Units
$t_{LHT}$	CML Low-to-High Transition Time	$R_L = 100\Omega$ (Figure 6)		150	330	ps
$t_{HLT}$	CML High-to-Low Transition Time	$R_L = 100\Omega$ (Figure 6)		150	330	ps
$t_{DIS}$	Data Input Setup to PCLK	Serializer Data Inputs (Figure 12)	2			ns
$t_{DIH}$	Data Input Hold from PCLK		2			ns
$t_{PLD}$	Serializer PLL Lock Time	$R_L = 100\Omega^{(1)(2)}$ , (Figure 13)		1	2	ms
$t_{SD}$	Serializer Delay <sup>(2)</sup>	$R_T = 100\Omega$ 10-bit mode Register 0x03h b[0] (TRFB = 1) (Figure 14)	32.5T	38T	44T	ns
		$R_T = 100\Omega$ 12-bit mode Register 0x03h b[0] (TRFB = 1) (Figure 14)	11.75T	13T	15T	ns
$t_{JIND}$	Serializer Output Deterministic Jitter	Serializer output intrinsic deterministic jitter. Measured (cycle-cycle) with PRBS-7 test pattern <sup>(3)(4)</sup>		0.13		UI
$t_{JINR}$	Serializer Output Random Jitter	Serializer output intrinsic random jitter (cycle-cycle). Alternating-1,0 pattern. <sup>(3)(4)</sup>		0.04		UI
$t_{JINT}$	Peak-to-peak Serializer Output Jitter	Serializer output peak-to-peak jitter includes deterministic jitter, random jitter, and jitter transfer from serializer input. Measured (cycle-cycle) with PRBS-7 test pattern. <sup>(3)(4)</sup>		0.396		UI
$\lambda_{STXBW}$	Serializer Jitter Transfer Function -3 dB Bandwidth <sup>(5)</sup>	PCLK = 100MHz 10-bit mode. Default Registers		2.2		MHz
		PCLK = 75MHz 12-bit high frequency mode. Default Registers		2.2		
		PCLK = 50MHz 12-bit low frequency mode. Default Registers		2.2		
$\delta_{STX}$	Serializer Jitter Transfer Function (Peaking) <sup>(5)</sup>	PCLK = 100MHz 10-bit mode. Default Registers		1.06		dB
		PCLK = 75MHz 12-bit high frequency mode. Default Registers		1.09		
		PCLK = 50MHz 12-bit low frequency mode. Default Registers		1.16		
$\delta_{STXf}$	Serializer Jitter Transfer Function (Peaking Frequency) <sup>(5)</sup>	PCLK = 100MHz 10-bit mode. Default Registers		400		kHz
		PCLK = 75MHz 12-bit high frequency mode. Default Registers		500		
		PCLK = 50MHz 12-bit low frequency mode. Default Registers		600		

- (1)  $t_{PLD}$  and  $t_{DDL}$  is the time required by the serializer and deserializer to obtain lock when exiting power-down state with an active PCLK
- (2) Specification is ensured by design.
- (3) Typical values represent most likely parametric norms at 1.8V or 3.3V,  $T_A = +25^\circ\text{C}$ , and at the Recommended Operation Conditions at the time of product characterization and are not specified.
- (4) UI – Unit Interval is equivalent to one ideal serialized data bit width. The UI scales with PCLK frequency.
- (5) Specification is ensured by characterization and is not tested in production.

## Deserializer Switching Characteristics

Over recommended operating supply and temperature ranges unless otherwise specified.

Symbol	Parameter	Conditions	Pin/Freq.	Min	Typ	Max	Units
$t_{RCP}$	Receiver Output Clock Period	10-bit mode	PCLK (Figure 18)	10		50	ns
		12-bit high frequency mode		13.33		66.66	
		12-bit low frequency mode		10		100	
$t_{PDC}$	PCLK Duty Cycle	10-bit mode	PCLK	45	50	55	%
		12-bit high frequency mode		40	50	60	
		12-bit low frequency mode		40	50	60	
$t_{CLH}$	LVC MOS Low-to-High Transition Time	$V_{DDIO}$ : 1.71V to 1.89V or 3.0V to 3.6V, $C_L = 8$ pF (lumped load) Default Registers (Figure 16) <sup>(1)</sup>	PCLK	1.3	2	2.8	ns
$t_{CHL}$	LVC MOS High-to-Low Transition Time			1.3	2	2.8	
$t_{CLH}$	LVC MOS Low-to-High Transition Time	$V_{DDIO}$ : 1.71V to 1.89V or 3.0V to 3.6V, $C_L = 8$ pF (lumped load) Default Registers (Figure 16) <sup>(1)</sup>	ROUT[11:0], HS, VS	1	2.5	4	ns
$t_{CHL}$	LVC MOS High-to-Low Transition Time			1	2.5	4	
$t_{ROS}$	ROUT Setup Data to PCLK	$V_{DDIO}$ : 1.71V to 1.89V or 3.0V to 3.6V, $C_L = 8$ pF (lumped load) Default Registers (Figure 18)	ROUT[11:0], HS, VS	0.38T	0.5T		ns
$t_{ROH}$	ROUT Hold Data to PCLK			0.38T	0.5T		
$t_{DD}$	Deserializer Delay	Default Registers Register 0x03h b[0] (RRFB = 1) (Figure 17) <sup>(1)</sup>	10-bit mode	154T		158T	ns
			12-bit low frequency mode	109T		112T	
			12-bit high frequency mode	73T		75T	
$t_{DDL T}$	Deserializer Data Lock Time	With Adaptive Equalization (Figure 15)	10-bit mode		15	22	ms
			12-bit low frequency mode		15	22	
			12-bit high frequency mode		15	22	
$t_{RCJ}$	Receiver Clock Jitter	PCLK SSCG[3:0] = OFF <sup>(1)</sup>	10-bit mode PCLK=100MHz		20	30	ps
			12-bit low frequency mode PCLK=50MHz		22	35	
			12-bit high frequency mode PCLK=75MHz		45	90	
$t_{DPJ}$	Deserializer Period Jitter	PCLK SSCG[3:0] = OFF <sup>(2)(1)</sup>	10-bit mode PCLK=100MHz		170	815	ps
			12-bit low frequency mode PCLK=50MHz		180	330	
			12-bit high frequency mode PCLK=75MHz		300	515	

(1) Specification is ensured by characterization and is not tested in production.

(2)  $t_{DPJ}$  is the maximum amount the period is allowed to deviate measured over 30,000 samples.

## Deserializer Switching Characteristics (continued)

Over recommended operating supply and temperature ranges unless otherwise specified.

Symbol	Parameter	Conditions	Pin/Freq.	Min	Typ	Max	Units
$t_{DCCJ}$	Deserializer Cycle-to-Cycle Clock Jitter	PCLK SSCG[3:0] = OFF <sup>(3)(1)</sup>	10-bit mode PCLK=100MHz		440	1760	ps
			12-bit low frequency mode PCLK=50MHz		460	730	
			12-bit high frequency mode PCLK=75MHz		565	985	
$f_{dev}$	Spread Spectrum Clocking Deviation Frequency	LVCMOS Output Bus SSC[3:0] = ON (Figure 23) <sup>(1)</sup>	10 MHz–100 MHz		±0.5 to ±1.5		%
$f_{mod}$	Spread Spectrum Clocking Modulation Frequency		10 MHz–100 MHz		5 to 50		kHz

(3)  $t_{DCCJ}$  is the maximum amount of jitter between adjacent clock cycles measured over 30,000 samples.

## AC Timing Specifications (SCL, SDA) - I<sup>2</sup>C Compliant

Over recommended supply and temperature ranges unless otherwise specified. (Figure 4)

Symbol	Parameter	Conditions	Min	Typ	Max	Units
<b>Recommended Input Timing Requirements</b>						
$f_{SCL}$	SCL Clock Frequency	Standard Mode	>0		100	kHz
		Fast Mode	>0		400	kHz
$t_{LOW}$	SCL Low Period	Standard Mode	4.7			μs
		Fast Mode	1.3			μs
$t_{HIGH}$	SCL High Period	Standard Mode	4.0			μs
		Fast Mode	0.6			μs
$t_{HD:STA}$	Hold time for a start or a repeated start condition	Standard Mode	4.0			μs
		Fast Mode	0.6			μs
$t_{SU:STA}$	Set Up time for a start or a repeated start condition	Standard Mode	4.7			μs
		Fast Mode	0.6			μs
$t_{HD:DAT}$	Data Hold Time	Standard Mode	0		3.45	μs
		Fast Mode	0		900	ns
$t_{SU:DAT}$	Data Set Up Time	Standard Mode	250			ns
		Fast Mode	100			ns
$t_{SU:STO}$	Set Up Time for STOP Condition	Standard Mode	4.0			μs
		Fast Mode	0.6			μs
$t_{BUF}$	Bus Free time between Stop and Start	Standard Mode	4.7			μs
		Fast Mode	1.3			μs
$t_r$	SCL & SDA Rise Time	Standard Mode			1000	ns
		Fast Mode			300	ns
$t_f$	SCL & SDA Fall Time	Standard Mode			300	ns
		Fast Mode			300	ns

## Bidirectional Control Bus DC Timing Specifications (SCL, SDA) - I<sup>2</sup>C Compliant<sup>(1)</sup>

Over recommended supply and temperature ranges unless otherwise specified

Symbol	Parameter	Conditions	Min	Typ	Max	Units
<b>Recommended Input Timing Requirements</b>						
$V_{IH}$	Input High Level	SDA and SCL	0.7* $V_{DDIO}$		$V_{DDIO}$	V

(1) Specification is ensured by design.

## Bidirectional Control Bus DC Timing Specifications (SCL, SDA) - I<sup>2</sup>C Compliant<sup>(1)</sup> (continued)

Over recommended supply and temperature ranges unless otherwise specified

Symbol	Parameter	Conditions	Min	Typ	Max	Units
$V_{IL}$	Input Low Level	SDA and SCL	GND		$0.3 \cdot V_{DDIO}$	V
$V_{HY}$	Input Hysteresis			>50		mV
$V_{OL}$	Output Low Level	SDA, $I_{OL}=0.5\text{mA}$	0		0.4	V
$I_{IN}$	Input Current	SDA or SCL, $V_{IN}=V_{DDOP}$ OR GND	—10		10	$\mu\text{A}$
$t_R$	SDA Rise Time-READ	SDA, RPU = 10k $\Omega$ , $C_b \leq 400\text{pF}$		430		ns
$t_F$	SDA Fall Time-READ	(Figure 4)		20		ns
$t_{SU;DAT}$		See Figure 4		560		ns
$t_{HD;DAT}$		See Figure 4		615		ns
$t_{SP}$				50		ns
$C_{IN}$		SDA or SCL		<5		pF

Addr (Hex)	Name	Bits	Field	R/W	Default	Description
0x00	I <sup>2</sup> C Device ID	7:1	DEVICE ID	RW	0x58'h	7-bit address of Serializer; 0x58'h (0101_1000X'b) default
		0	SER ID SEL			0: Device ID is from ID[x] 1: Register I <sup>2</sup> C Device ID overrides ID[x]
0x01	Power and Reset	7	RSVD			Reserved
		6	RDS	RW	0	Digital Output Drive Strength 1: High Drive Strength 0: Low Drive Strength
		5	VDDIO Control	RW	1	Auto Voltage Control 1: Enable 0: Disable
		4	VDDIO MODE	RW	1	V <sub>DDIO</sub> Voltage set 0: 1.8V 1: 3.3V
		3	ANAPWDN	RW	0	This register can be set only through local I <sup>2</sup> C access 1: Analog power-down : Powers Down the analog block in the Serializer 0: No effect
		2	RSVD	RW	0	Reserved
		1	DIGITAL RESET1	RW	0	1: Resets the digital block except for register values values. Does not affect device I <sup>2</sup> C Bus or Device ID. This bit is self-clearing. 0: Normal Operation
		0	DIGITAL RESET0	RW	1	1: Digital Reset, resets the entire digital block including all register values. This bit is self-clearing. 0: Normal Operation.
0x02	RESERVED					

**Table 1. DS90UB913Q Control Registers (continued)**

Addr (Hex)	Name	Bits	Field	R/W	Default	Description
0x03	General Configuration	7	RX CRC Checker Enable	RW	1	Back-channel CRC Checker Enable 1: Enabled 0: Disabled
		6	TX Parity Generator Enable	RW	1	Forward channel Parity Generator Enable 1: Enable 0: Disable
		5	CRC Error Reset	RW	0	Clear CRC Error Counters. This bit is NOT self-clearing. 1: Clear Counters 0: Normal Operation
		4	I <sup>2</sup> C Remote Write Auto Acknowledge	RW	0	Automatically Acknowledge I2C Remote Write. The mode works when the system is LOCKed. 1: Enable: When enabled, I <sup>2</sup> C writes to the Deserializer (or any remote I2C Slave, if I <sup>2</sup> C PASS ALL is enabled) are immediately acknowledged without waiting for the Deserializer to acknowledge the write. The accesses are then remapped to address specified in 0x06. 0: Disable
		3	I <sup>2</sup> C Pass All	RW	0	1: Enable Forward Control Channel pass-through of all I <sup>2</sup> C accesses to I2C Slave IDs that do not match the Serializer I2C Slave ID. <b>The I<sup>2</sup>C accesses are then remapped to address specified in register 0x06.</b> 0: Enable Forward Control Channel pass-through only of I <sup>2</sup> C accesses to I <sup>2</sup> C Slave IDs matching either the remote Deserializer Slave ID or the remote Slave ID.
		2	I <sup>2</sup> C PASSTHROUGH	RW	1	I <sup>2</sup> C Pass-Through Mode 0: Pass-Through Disabled 1: Pass-Through Enabled
		1	OV_CLK2PLL	RW	0	1: Enabled : When enabled this registers overrides the clock to PLL mode (External Oscillator mode or Direct PCLK mode) defined through MODE pin and allows selection through register 0x35 in the Serializer 0: Disabled : When disabled, cClock to PLL mode (External Oscillator mode or Direct PCLK mode) is defined through MODE pin on the Serializer.
		0	TRFB	RW	1	Pixel Clock Edge Select 1: Parallel Interface Data is strobed on the Rising Clock Edge. 0: Parallel Interface Data is strobed on the Falling Clock Edge.
0x04	RESERVED					
0x05	Mode Select	7	RSVD	RW	0	Reserved
		6	RSVD	RW	0	Reserved.
		5	MODE_OVERRID E	RW	0	Allows overriding mode select bits coming from back-channel 1: Overrides MODE select bits 0: Does not override MODE select bits
		4	MODE_UP To DATE	R	0	Indicates that the status of mode select from Deserializer is up to date
		3	Pin_MODE_12-bit High Frequency	R	0	1: 12 bit high frequency mode is selected. 0: 12 bit high frequency mode is not selected.
		2	Pin_MODE_10-bit mode	R	0	1: 10 bit mode is selected. 0: 10 bit mode is not selected.
		1:0	RSVD			Reserved

**Table 1. DS90UB913Q Control Registers (continued)**

Addr (Hex)	Name	Bits	Field	R/W	Default	Description
0x06	DES ID	7:1	Desializer Device ID	RW	0x00	7-bit Deserializer Device ID Configures the I <sup>2</sup> C Slave ID of the remote Deserializer. A value of 0 in this field disables I <sup>2</sup> C access to the remote Deserializer. This field is automatically configured by the Bidirectional Control Channel once RX Lock has been detected. Software may overwrite this value, but should also assert the FREEZE DEVICE ID bit to prevent overwriting by the Bidirectional Control Channel.
		0	Freeze Device ID	RW	0	1: Prevents auto-loading of the Deserializer Device ID by the bidirectional control channel. The ID will be frozen at the value written. 0: Update
0x07	DESAlias	7:1	Deserializer ALIAS ID	RW	0	7-bit Remote Deserializer Device Alias ID Configures the decoder for detecting transactions designated for an I <sup>2</sup> C Deserializer device. The transaction will be remapped to the address specified in the DES ID register. A value of 0 in this field disables access to the remote I <sup>2</sup> C Slave.
		0	RSVD			Reserved
0x08	SlaveID	7:1	SLAVE ID	RW	0x00	7-bit Remote Slave Device ID Configures the physical I <sup>2</sup> C address of the remote I <sup>2</sup> C Slave device attached to the remote Deserializer. If an I <sup>2</sup> C transaction is addressed to the Slave Alias ID, the transaction will be remapped to this address before passing the transaction across the Bidirectional Control Channel to the Deserializer. A value of 0 in this field disables access to the remote I <sup>2</sup> C slave.
		0	RSVD			Reserved
0x09	SlaveAlias	7:1	SLAVE ALIAS ID	RW	0x00	7-bit Remote Slave Device Alias ID Configures the decoder for detecting transactions designated for an I <sup>2</sup> C Slave device attached to the remote Deserializer. The transaction will be remapped to the address specified in the Slave ID register. A value of 0 in this field disables access to the remote I <sup>2</sup> C Slave.
		0	RSVD			Reserved
0x0A	CRC Errors	7:0	CRC Error Byte 0	R	0	Number of back-channel CRC errors during normal operation Least Significant byte
0x0B	CRC Errors	7:0	CRC Error Byte 1	R	0	Number of back-channel CRC errors during normal operation Most Significant byte
0x0C	General Status	7:5	Rev-ID	R	0	Revision ID 0x00: Production
		4	RX Lock Detect	R	0	1: RX LOCKED 0: RX not LOCKED
		3	BIST CRC Error Status	R	0	1: CRC errors in BIST mode 0: No CRC errors in BIST mode
		2	PCLK Detect	R	0	1: Valid PCLK detected 0: Valid PCLK not detected
		1	DES Error	R	0	1: CRC error is detected during communication with Deserializer. This bit is cleared upon loss of link or assertion of CRC ERROR RESET in register 0x04. 0: No effect
		0	LINK Detect	R	0	1: Cable link detected 0: Cable link not detected This includes any of the following faults — Cable Open — '+' and '-' shorted — Short to GND — Short to battery

**Table 1. DS90UB913Q Control Registers (continued)**

Addr (Hex)	Name	Bits	Field	R/W	Default	Description
0x0D	GPO[0] and GPO[1] Configuration	7	GPO1 Output Value	RW	0	Local GPIO Output Value This value is output on the GPIO pin when the GPIO function is enabled, the local GPIO direction is Output, and remote GPIO control is disabled.
		6	GPO1 Remote Enable	RW	1	Remote GPIO Control 1: Enable GPIO control from remote Deserializer. The GPIO pin needs to be an output, and the value is received from the remote Deserializer. 0: Disable GPIO control from remote Deserializer.
		5	GPO1 Direction	RW	0	1: Input 0: Output
		4	GPO0 Enable	RW	1	1: GPIO enable 0: Tri-state
		3	GPO0 Output Value	RW	0	Local GPIO Output Value This value is output on the GPIO pin when the GPIO function is enabled, the local GPIO direction is Output, and remote GPIO control is disabled.
		2	GPO0 Remote Enable	RW	1	Remote GPIO Control 1: Enable GPIO control from remote Deserializer. The GPIO pin needs to be an output, and the value is received from the remote Deserializer. 0: Disable GPIO control from remote Deserializer.
		1	GPO0 Direction	RW	0	1: Input 0: Output
		0	GPO0 Enable	RW	1	1: GPIO enable 0: Tri-state
0x0E	GPO[2] and GPO[3] Configuration	7	GPO3 Output Value	RW	0	Local GPIO Output Value This value is output on the GPIO pin when the GPIO function is enabled, the local GPIO direction is Output, and remote GPIO control is disabled.
		6	GPO3 Remote Enable	RW	0	Remote GPIO Control 1: Enable GPIO control from remote Deserializer. The GPIO pin needs to be an output, and the value is received from the remote Deserializer. 0: Disable GPIO control from remote Deserializer.
		5	GPO3 Direction	RW	1	1: Input 0: Output
		4	GPO3 Enable	RW	1	1: GPIO enable 0: Tri-state
		3	GPO2 Output Value	RW	0	Local GPIO Output Value This value is output on the GPIO pin when the GPIO function is enabled, the local GPIO direction is Output, and remote GPIO control is disabled.
		2	GPO2 Remote Enable	RW	1	Remote GPIO Control 1: Enable GPIO control from remote Deserializer. The GPIO pin needs to be an output, and the value is received from the remote Deserializer. 0: Disable GPIO control from remote Deserializer.
		1	GPO2 Direction	RW	0	1: Input 0: Output
		0	GPO2 Enable	RW	1	1: GPIO enable 0: Tri-state

**Table 1. DS90UB913Q Control Registers (continued)**

Addr (Hex)	Name	Bits	Field	R/W	Default	Description
0x0F	I <sup>2</sup> C Master Config	7:5	RSVD			Reserved
		4:3	SDA Output Delay	RW	00	SDA Output Delay This field configures output delay on the SDA output. Setting this value will increase output delay in units of 50ns. Nominal output delay values for SCL to SDA are: 00 : 350ns 01: 400ns 10: 450ns 11: 500ns
		2	Local Write Disable	RW	0	Disable Remote Writes to Local Registers Setting this bit to a 1 will prevent remote writes to local device registers from across the control channel. This prevents writes to the Serializer registers from an I <sup>2</sup> C master attached to the Deserializer. Setting this bit does not affect remote access to I <sup>2</sup> C slaves at the Serializer.
		1	I2C Bus Timer Speed up	RW	0	Speed up I2C Bus Watchdog Timer 1: Watchdog Timer expires after approximately 50 microseconds 0: Watchdog Timer expires after approximately 1 second.
		0	I2C Bus Timer Disable	RW	0	1. Disable I <sup>2</sup> C Bus Watchdog Timer When the I <sup>2</sup> C Watchdog Timer may be used to detect when the I <sup>2</sup> C bus is free or hung up following an invalid termination of a transaction. If SDA is high and no signalling occurs for approximately 1 second, the I <sup>2</sup> C bus will assumed to be free. If SDA is low and no signaling occurs, the device will attempt to clear the bus by driving 9 clocks on SCL 0: No effect
0x10	I2C Control	7	RSVD			Reserved
		6:4	SDA Hold Time	RW	0x1	Internal SDA Hold Time. This field configures the amount of internal hold time provided for the SDA input relative to the SCL input. Units are 50ns.
		3:0	I2C Filter Depth	RW	0x7	I2C Glitch Filter Depth This field configures the maximum width of glitch pulses on the SCL and SDA inputs that will be rejected. Units are 10ns.
0x11	SCL High Time	7:0	SCL High Time	RW	0x82	I2C Master SCL High Time This field configures the high pulse width of the SCL output when the Serializer is the Master on the local I2C bus. Units are 50 ns for the nominal oscillator clock frequency. The default value is set to provide a minimum (4μs + 1μs of rise time for cases where rise time is very fast) SCL high time with the internal oscillator clock running at 26MHz rather than the nominal 20MHz.
0x12	SCL LOW Time	7:0	SCL Low Time	RW	0x82	I <sup>2</sup> C SCL Low Time This field configures the low pulse width of the SCL output when the Serializer is the Master on the local I <sup>2</sup> C bus. This value is also used as the SDA setup time by the I <sup>2</sup> C Slave for providing data prior to releasing SCL during accesses over the Bidirectional Control Channel. Units are 50 ns for the nominal oscillator clock frequency. The default value is set to provide a minimum (4.7μs + 0.3μs of fall time for cases where fall time is very fast) SCL low time with the internal oscillator clock running at 26MHz rather than the nominal 20MHz.
0x13	General Purpose Control	7:0	GPCR[7:0]	RW	0	1: High 0: Low

10	50 MHz	37.5 MHz	25 MHz
11	25MHz	18.75 MHz	12.5 MHz

## Functional Description

The DS90UB913/914Q FPD- Link III chipsets are intended to link mega-pixel camera imagers and video processors in ECUs. The Serializer/Deserializer chipset can operate from 10MHz to 100MHz pixel clock frequency. The DS90UB913Q device transforms a 10/12-bit wide parallel LVCMOS data bus along with a bidirectional control channel control bus into a single high-speed differential pair. The high speed serial bit stream contains an embedded clock and DC-balanced information which enhances signal quality to support AC coupling. The DS90UB914Q device receives the single serial data stream and converts it back into a 10/12-bit wide parallel data bus together with the control channel data bus. The DS90UB913/914Q chipsets can accept up to

- 12 bits of DATA+2 bits SYNC for an input PCLK range of 10MHz-50MHz in the 12-bit low frequency mode
- 12 bits DATA + 2 SYNC bits for an input PCLK range of 15MHz to 75MHz in the 12-bit high frequency mode
- 10 bits DATA + 2 SYNC bits for an input PCLK range of 20MHz to 100MHz in the 10-bit mode.

The DS90UB914Q chipset has a 2:1 multiplexer which allows customers to select between two Serializer inputs. The control channel function of the DS90UB913/DS90UB914Q chipset provides bidirectional communication between the image sensor and ECUs. The integrated bidirectional control channel transfers data bidirectionally over the same differential pair used for video data interface. This interface offers advantages over other chipsets by eliminating the need for additional wires for programming and control. The bidirectional control channel bus is controlled via an I2C port. The bidirectional control channel offers asymmetrical communication and is not dependent on video blanking intervals.

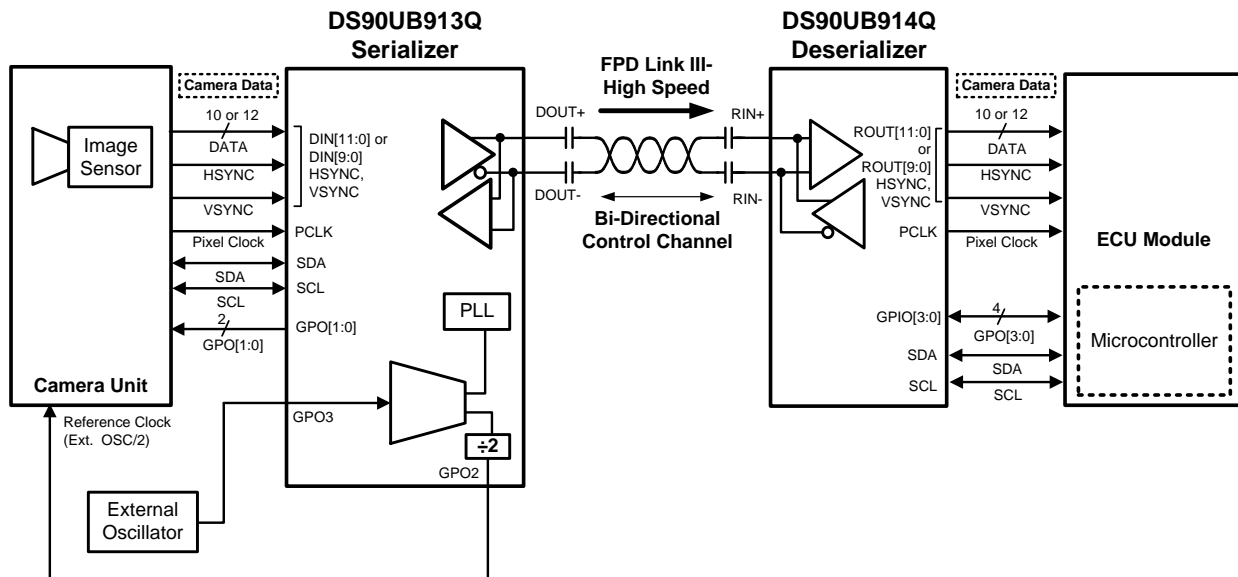

The DS90UB913/914Q chipset offer customers the choice to work with different clocking schemes. The DS90UB913/914Q chipsets can use an external oscillator as the reference clock source for the PLL or PCLK from the imager as primary reference clock to the PLL.

## Transmission Media

The DS90UB913/914Q chipset is intended to be used in a point-to-point configuration through a shielded twisted pair cable. The Serializer and Deserializer provide internal termination to minimize impedance discontinuities. The interconnect (cable and connectors) should have a differential impedance of 100 Ohms. The maximum length of cable that can be used is dependent on the quality of the cable (gauge, impedance), connector, board(discontinuities, power plane), the electrical environment (e.g power stability, ground noise, input clock jitter, PCLK frequency, etc). The resulting signal quality at the receiving end of the transmission media may be assessed by monitoring the differential eye opening of the serial data stream. A differential probe should be used to measure across the termination resistor at the CMLOUTP/N pins. [Figure 19](#) illustrates the minimum eye width and eye height that is necessary for bit error free operation.

## DS90UB913/914Q Operation with External Oscillator as Reference Clock

In some applications, the pixel clock that comes from the imager can have jitter which exceeds the tolerance of the DS90UB913/914Q chipsets. In this case, the DS90UB913Q device should be operated by using an external clock source as the reference clock for the DS90UB913/914Q chipsets. **This is the recommended operating mode.** The external oscillator clock output goes through a divide-by-2 circuit in the DS90UB913Q Serializer and this divided clock output is used as the reference clock for the imager. The output data and pixel clock from the imager are then fed into the DS90UB913Q device. [Figure 24](#) shows the operation of the DS90UB13/914Q chipsets while using an external automotive grade oscillator.

**Figure 24. DS90UB913/914Q Operation in the External Oscillator Mode**

When the DS90UB913Q device is operated using an external oscillator, the GPO3 pin on the DS90UB913Q is the input pin for the external oscillator. In applications where the DS90UB913Q device is operated from an external oscillator, the divide-by-2 circuit in the DS90UB913Q device feeds back the divided clock output to the imager device through GPO2 pin. The pixel clock to external oscillator ratios needs to be fixed for the 12-bit high frequency mode and the 10-bit mode. **In the 10-bit mode, the pixel clock frequency divided by the external oscillator frequency must be 2. In the 12-bit high frequency mode, the pixel clock frequency divided by the external oscillator frequency must be 1.5.** For example, if the external oscillator frequency is 48MHz in the 10-bit mode, the pixel clock frequency of the imager needs to be twice of the external oscillator frequency, i.e. 96MHz. If the external oscillator frequency is 48MHz in the 12-bit high frequency mode, the pixel clock frequency of the imager needs to be 1.5 times of the external oscillator frequency, i.e. 72MHz. In this mode, GPO2 and GPO3 on the Serializer cannot act as the output of the input signal coming from GPIO2 or GPIO3 on the Deserializer.

#### DS90UB913/914Q Operation with Pixel Clock from Imager as Reference Clock

The DS90UB913/914Q chipsets can be operated by using the pixel clock from the imager as the reference clock. [Figure 25](#) shows the operation of the DS90UB913/914Q chipsets using the pixel clock from the imager. If the DS90UB913Q device is operated using the pixel clock from the imager as the reference clock, then the imager uses an external oscillator as its reference clock. There are 4 GPIOs on the Serializer and 4 GPIOs on the Deserializer in this mode.

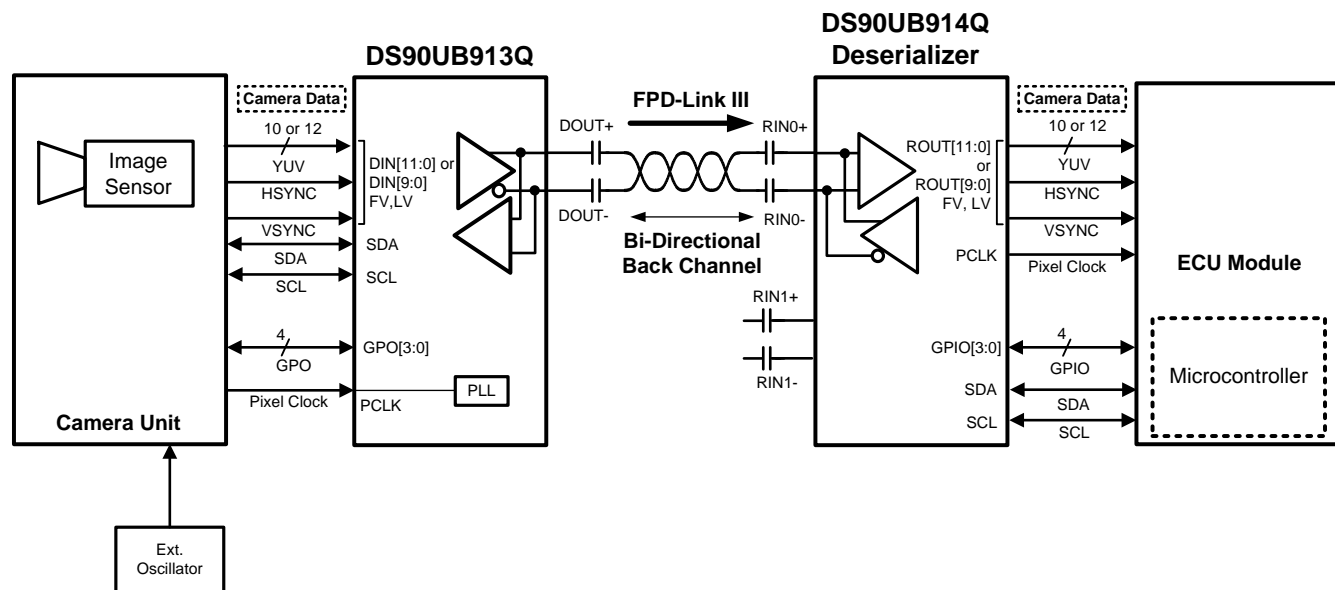

Figure 25. DS90UB913Q/914Q Operation in PCLK mode

#### MODE Pin on Serializer

The mode pin on the Serializer can be configured to select if the DS90UB913Q device is to be operated from the external oscillator or the PCLK from the imager. The pin must be pulled to  $V_{DD}$  (1.8V, not  $V_{DDIO}$ ) with a 10 k $\Omega$  resistor and a pull down resistor ( $R_{MODE}$ ) of the recommended value to set the modes shown in Figure 26. The recommended maximum resistor tolerance is 1%.

Figure 26. MODE Pin configuration on DS90UB913Q

Table 5. DS90UB913Q Serializer MODE Resistor Value

DS90UB913Q Serializer MODE Resistor Value	
Mode Select	$R_{MODE}$ Resistor Value
PCLK from imager mode	100k $\Omega$
External Oscillator mode	4.7k $\Omega$

## MODE Pin on Deserializer

The mode pin on the Deserializer can be used to configure the device to work in the 12-bit low frequency mode, 12-bit high frequency mode or the 10-bit mode of operation. Internally, the DS90UB913/914Q chipset operates in a divide-by-1 mode in the 12-bit low frequency mode, divide-by-2 mode in the 10-bit mode and a divide-by-1.5 mode in the 12-bit high frequency mode. The pin must be pulled to  $V_{DD}$  (1.8V, not  $V_{DDIO}$ ) with a 10 k $\Omega$  resistor and a pull down resistor ( $R_{MODE}$ ) of the recommended value to set the different modes in the Deserializer as mentioned in Table 6. The Deserializer automatically configures the Serializer to correct mode via the back-channel. The recommended maximum resistor tolerance is 1%.

Figure 27. Mode Pin Configuration on DS90UB914Q Deserializer

Table 6. DS90UB914Q Deserializer MODE Resistor Value

DS90UB914Q Deserializer MODE resistor Value	
MODE Select	$R_{MODE}$ Resistor Value
<b>12-bit low frequency mode</b> 10-50 MHz PCLK, 10/12 bits DATA+ 2 SYNC	0 $\Omega$
<b>12-bit high frequency mode</b> 15-75 MHz PCLK, 10/12 bits DATA+ 2 SYNC	3k $\Omega$
<b>10-bit mode</b> 20 MHz – 100 MHz PCLK, 10 bits DATA+ 2 SYNC	11k $\Omega$

## Line Rate Calculations for the DS90UB913/914Q

The DS90UB913Q device divides the clock internally by divide-by-1 in the 12 bit low frequency mode, by divide-by-2 in the 10-bit mode and by divide-by-1.5 in the 12-bit high frequency mode. Conversely, the DS90UB914Q multiplies the recovered serial clock to generate the proper pixel clock output frequency. Thus the maximum line rate in the three different modes remains 1.4Gbps. The following are the formulae used to calculate the maximum line rate in the different modes.

- For 12 bit low frequency mode, Line rate =  $f_{PCLK} * 28$ ; e.g.  $f_{PCLK}=50\text{MHz}$ , line rate =  $50 * 28 = 1.4\text{Gbps}$
- For 10 bit mode, Line rate =  $f_{PCLK} / 2 * 28$ ; e.g.  $f_{PCLK}=100\text{MHz}$ , line rate =  $(100/2) * 28 = 1.4\text{Gbps}$
- For the 12 bit high frequency mode, Line rate =  $f_{PCLK} * (2/3) * 28$ ; e.g.  $f_{PCLK}=75\text{MHz}$ , line rate =  $(75) * (2/3) * 28 = 1.4\text{Gbps}$

## Deserializer Multiplexer Input

The DS90UB914Q offers a 2:1 multiplexer that can be used to select which camera is used as the input. Figure 28 shows the operation of the 2:1 multiplexer in the Deserializer. The selection of the camera can be pin controlled as well as register controlled. Both the Deserializer inputs cannot be enabled at the same time. If the Serializer A is selected as the active Serializer, the back-channel for Deserializer A turns ON and vice versa. To switch between the two cameras, first the Serializer B has to be selected using the SEL pin/register on the Deserializer. After that the back channel driver for Deserializer B has to be enabled using the register in the Deserializer.

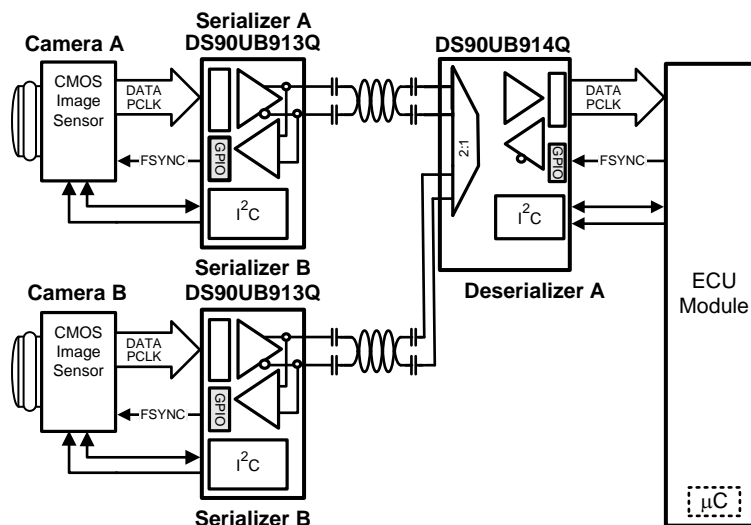

Figure 28. Using the multiplexer on the Deserializer to enable a two camera system

## Serial Frame Format

The High Speed Forward Channel is composed of 28 bits of data containing video data, sync signals, I2C and parity bits. This data payload is optimized for signal transmission over an AC coupled link. Data is randomized, balanced and scrambled. The 28 bits frame structure changes in the 12 bit low frequency mode, 12 bit high frequency mode and the 10 bit mode internally and is seamless to the customer. The bidirectional control channel data is transferred over the single serial link along with the high-speed forward data. This architecture provides a full duplex low speed forward and backward path across the serial link together with a high speed forward channel without the dependence on the video blanking phase.

## Error Detection

The chipset provides error detection operations for validating data integrity in long distance transmission and reception. The data error detection function offers users flexibility and usability of performing bit-by-bit data transmission error checking. The error detection operating modes support data validation of the following signals:

- Bidirectional control channel data across the serial link
- Parallel video/sync data across the serial link

The chipset provides 1 parity bit on the forward channel and 4 CRC bits on the back channel for error detection purposes. The DS90UB913/914Q chipset checks the forward and back channel serial links for errors and stores the number of detected errors in two 8-bit registers in the Serializer and the Deserializer respectively.

To check parity errors on the forward channel, monitor registers 0x1A and 0x1B on the Deserializer. If there is a loss of LOCK, then the counters on registers 0x1A and 0x1B are reset. **Whenever there is a parity error on the forward channel, the PASS pin will go low.**

To check CRC errors on the back-channel, monitor registers 0x0A and 0x0B on the Serializer.

## Description of Bidirectional Control Bus and I2C Modes

The I2C compatible interface allows programming of the DS90UB913Q, DS90UB914Q, or an external remote device (such as image sensor) through the bidirectional control channel. Register programming transactions to/from the DS90UB913Q/914Q chipset are employed through the clock (SCL) and data (SDA) lines. These two signals have open drain I/Os and both lines must be pulled-up to VDDIO by an external resistor. Pull-up resistors or current sources are required on the SCL and SDA busses to pull them high when they are not being driven low. A logic LOW is transmitted by driving the output low. Logic HIGH is transmitted by releasing the output and allowing it to be pulled-up externally. The appropriate pull-up resistor values will depend upon the total bus capacitance and operating speed. The DS90UB913/914Q I2C bus data rate supports up to 400 kbps according to I2C fast mode specifications.

Figure 29. Write Byte

Figure 30. Read Byte

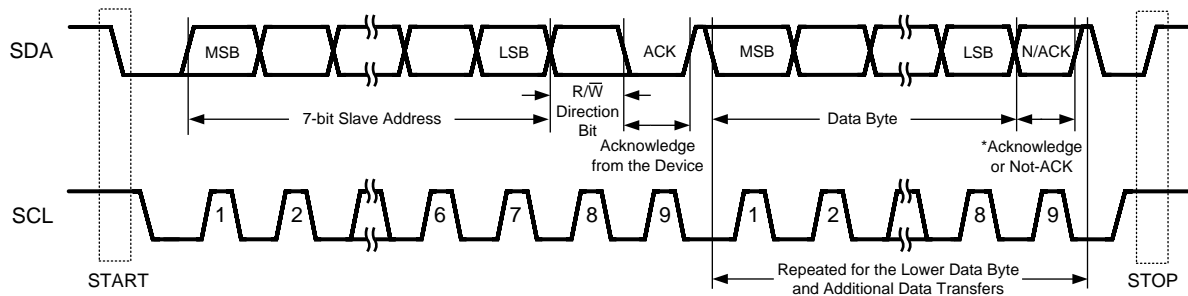

Figure 31. Basic Operation

Figure 32. Start and Stop Conditions

### Slave Clock Stretching

The I2C compatible interface allows programming of the DS90UB913Q, DS90UB914Q, or an external remote device (such as image sensor) through the bidirectional control To communicate and synchronize with remote devices on the I2C bus through the bidirectional control channel/MCU, **the chipset utilizes bus clock stretching (holding the SCL line low) during data transmission**; where the I2C slave pulls the SCL line low on the 9th clock of every I2C transfer (before the ACK signal). The slave device will not control the clock and only stretches it until the remote peripheral has responded. The I2C master must support clock stretching to operate with the DS90UB913/914Q chipset.

## I2C Pass Through

I2C pass-through provides an alternative means to independently address slave devices. The mode enables or disables I2C bidirectional control channel communication to the remote I2C bus. This option is used to determine whether or not an I2C instruction is to be transferred over to the remote I2C device. When enabled, the I2C bus traffic will continue to pass through, I2C commands will be excluded to the remote I2C device. The pass through function also provides access and communication to only specific devices on the remote bus.

See Figure 33 for an example of this function.

If master controller transmits I2C transaction for address 0xA0, the SER A with I2C pass through enabled will transfer I2C commands to remote Camera A. The SER B with I2C pass through disabled, any I2C commands will be bypassed on the I2C bus to Camera B.

Figure 33. I2C Pass Through

## ID[x] Address Decoder on the Serializer

The ID[x] pin on the Serializer is used to decode and set the physical slave address of the Serializer (I2C only) to allow up to five devices on the bus connected to the Serializer using only a single pin. The pin sets one of the 5 possible addresses for each Serializer device. The pin must be pulled to VDD (1.8V, not VDDIO) with a 10 kΩ resistor and a pull down resistor (RID) of the recommended value to set the physical device address. The recommended maximum resistor tolerance is 1%.

Figure 34. ID[x] Address Decoder on the Serializer

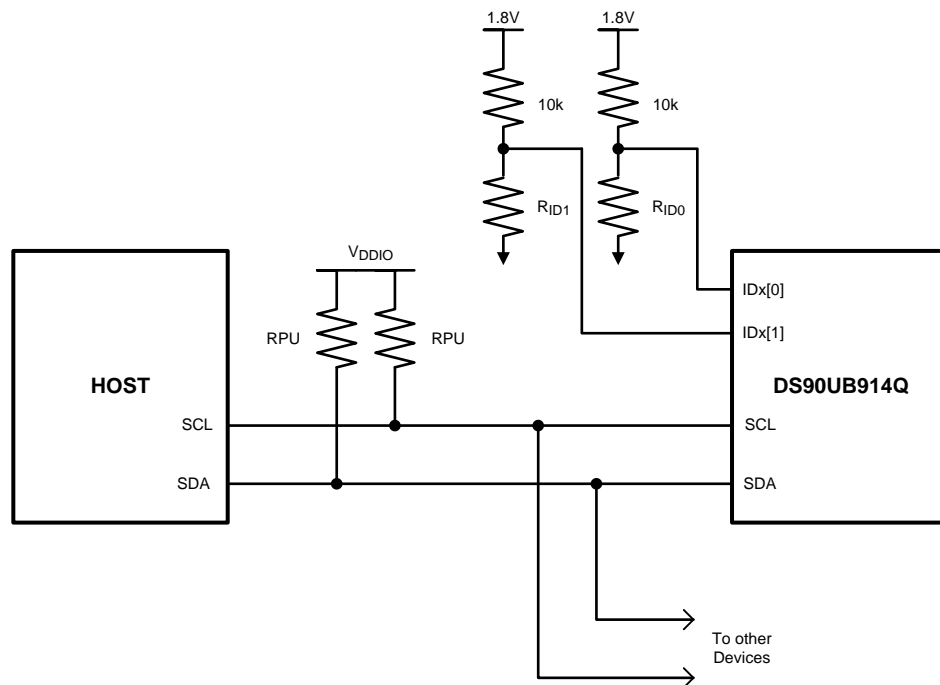

Table 7. ID[x] Resistor Value for DS90UB913Q Serializer

ID[x] Resistor Value — DS90UB913Q Serializer		
Resistor RID0 $\Omega$ (1% Tolerance)	Address 7'b	Address 8'b 0 appended (WRITE)
0k	0x58	0xB0
2k	0x59	0xB2
4.7k	0x5A	0xB4
8.2k	0x5B	0xB6
14k	0x5C	0xB8
100k	0x5D	0xBA

### ID[x] Address Decoder on the Deserializer

The IDx[0] and IDx[1] pins on the Deserializer are used to decode and set the physical slave address of the Deserializer (I2C only) to allow up to 16 devices on the bus using only two pins. The pins set one of 16 possible addresses for each Deserializer device. As there will be more Deserializer devices connected on the same board than Serializers, more I2C device addresses have been defined for the DS90UB914Q Deserializer than the DS90UB913Q Serializer. The pins must be pulled to VDD (1.8V, not VDDIO) with a 10 k $\Omega$  resistor and two pull down resistors (RID0 and RID1) of the recommended value to set the physical device address. The recommended maximum resistor tolerance is 1%.

**Figure 35. ID[x] Address Decoder on the Deserializer**

### Table 8. Resistor Values for IDx[0] and IDx[1] on DS90UB914Q Deserializer

ID[x] Resistor Value — DS90UB913Q Serializer

100k	100k	0x6F	0XDE

### Clock-Data Recovery Status Flag (LOCK), Output Enable (OEN) and Output State Select (OSS\_SEL)

When PDB is driven HIGH, the Deserializer's CDR PLL begins locking to the serial input and LOCK is TRI-STATE or LOW (depending on the value of the OEN setting). After the DS90UB914Q completes its lock sequence to the input serial data, the LOCK output is driven HIGH, indicating valid data and clock recovered from the serial input is available on the parallel bus and PCLK outputs. The states of the outputs are based on the OEN and OSS\_SEL setting (Table 5). See Figure 19.

**Table 9. Output States**

Inputs				Outputs			
Serial Inputs	PDB	OEN	OSS	LOCK	Pass	DATA, GPIO, I2S	CLK
X	0	X	X	Z	Z	Z	Z
X	1	0	0	L or H	L	L	L
X	1	0	1	L or H	Z	Z	Z
Static	1	1	0	L	L	L	L/Osc(Register Bit Enable)
Static	1	1	1	H	Previous State	L	L
Active	1	1	0	H	L	L	L
Active	1	1	1	H	Valid	Valid	Valid

### Programmable Controller

An integrated I2C slave controller is embedded in the DS90UB913Q Serializer as well as the DS90UB914Q Deserializer. It must be used to configure the extra features embedded within the programmable registers or it can be used to control the set of programmable GPIOs.

### Multiple Device Addressing

Some applications require multiple camera devices with the same fixed address to be accessed on the same I<sup>2</sup>C bus. The DS90UB913/914 provides slave ID matching/aliasing to generate different target slave addresses when connecting more than two identical devices together on the same bus. This allows the slave devices to be independently addressed. Each device connected to the bus is addressable through a unique ID by programming of the SLAVE\_ID\_MATCH register on Deserializer. This will remap the SLAVE\_ID\_MATCH address to the target SLAVE\_ID\_INDEX address; up to 8 ID indexes are supported. The ECU Controller must keep track of the list of I<sup>2</sup>C peripherals in order to properly address the target device.

See [Figure 36](#) for an example of this function.

- ECU is the I<sup>2</sup>C master and has an I<sup>2</sup>C master interface
- The I<sup>2</sup>C interfaces in DES A and DES B are both slave interfaces
- The I<sup>2</sup>C protocol is bridged from DES A to SER A and from DES B to SER B
- The I<sup>2</sup>C interfaces in SER A and SER B are both master interfaces

If master controller transmits I<sup>2</sup>C slave 0xA0, the DES A address 0xC0 will forward the transaction to remote Camera A. If the controller transmits slave address 0xA4, the DES B 0xC2 will recognize that 0xA4 is mapped to 0xA0 and will be transmitted to the remote Camera B. If controller sends command to address 0xA6, the DES B 0xC2 will forward transaction to slave device 0xA2.

The Slave ID index/match is supported only in the camera mode (SER: MODE pin = L; DES: MODE pin = H). For Multiple device addressing in display mode (SER: MODE pin = H; DES: MODE pin = L), use the I<sup>2</sup>C pass through function.

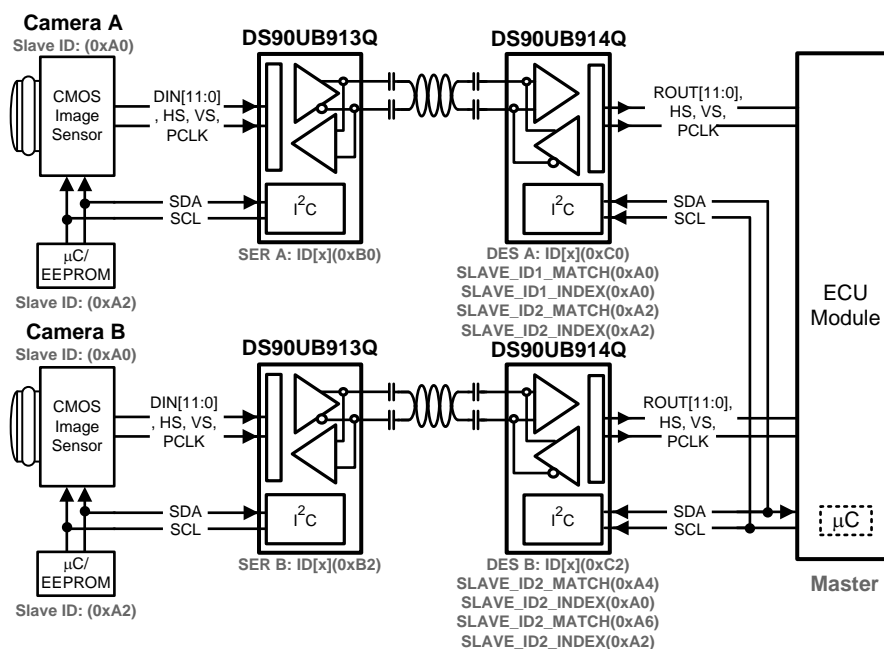

Figure 36. Multiple Device Addressing

### Synchronizing Multiple Cameras

For applications requiring multiple cameras for frame-synchronization, it is recommended to utilize the General Purpose Input/Output (GPIO) pins to transmit control signals to synchronize multiple cameras together. To synchronize the cameras properly, the system controller needs to provide a field sync output (such as a vertical or frame sync signal) and the cameras must be set to accept an auxiliary sync input. The vertical synchronize signal corresponds to the start and end of a frame and the start and end of a field. Note this form of synchronization timing relationship has a non-deterministic latency. After the control data is reconstructed from the bidirectional control channel, there will be a time variation of the GPIO signals arriving at the different target devices (between the parallel links). The maximum latency delta ( $t_1$ ) of the GPIO data transmitted across multiple links is 25 $\mu$ s.

Note: The user must verify that the timing variations between the different links are within their system and timing specifications.

See [Figure 37](#) for an example of this function.

The maximum time ( $t_1$ ) between the rising edge of GPIO (i.e. sync signal) arriving at Camera A and Camera B is 25 $\mu$ s.

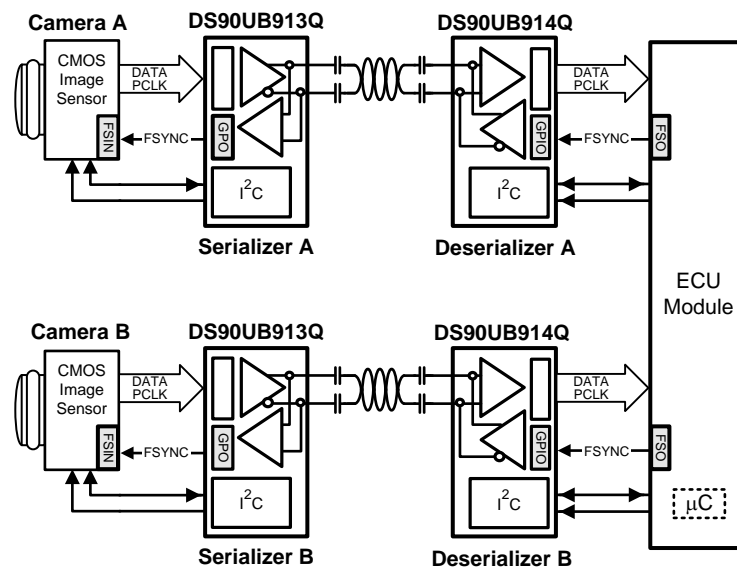

Figure 37. Synchronizing Multiple Cameras

Figure 38. GPIO Delta Latency

### General Purpose I/O (GPIO) Descriptions

There are 4 GPOs on the Serializer and 4 GPIOs on the Deserializer when the DS90UB913/914Q chipsets are run off the pixel clock from the imager as the reference clock source. The GPOs on the Serializer can be configured as outputs for the input signals that are fed into the Deserializer GPIOs. In addition, the GPOs on the Serializer can behave as outputs of the local register on the Serializer. The GPIOs on the Deserializer can be configured to be the input signals feeding the output of the GPOs on the Serializer. In addition the GPIOs on the Deserializer can be configured to behave as outputs of the local register on the Deserializer. If the DS90UB913/914Q chipsets are run off the external oscillator source as the reference clock, then GPO3 on the Serializer is automatically configured to be the input for the external clock and GPIO2 on the Deserializer is configured to be the output of the divide-by-2 clock which is fed into the imager as its reference clock. In this case, the GPIO2 and GPIO3 on the Deserializer can only behave as outputs of the local register on the Deserializer. The GPIO maximum switching rate is up to 66 kHz when configured for communication between Deserializer GPIO to Serializer GPO.

### LVCMOS VDDIO Option

1.8V/2.8V/3.3V Serializer inputs and 1.8V/3.3V Deserializer outputs are user configurable to provide compatibility with 1.8V, 2.8V and 3.3V system interfaces.

## Deserializer – Adaptive Input Equalization(AEQ)

The receiver inputs provide an adaptive input equalization filter in order to compensate for loss from the media. The level of equalization can also be manually selected via register controls. The fully adaptive equalizer output can be seen using the CMLOUTP/CMLOUTN pins in the Deserializer.

**Figure 39. Maximum Equalizer Gain vs. Line Frequency**

## EMI Reduction

### Deserializer Staggered Output

The receiver staggers output switching to provide a random distribution of transitions within a defined window. Outputs transitions are distributed randomly. This minimizes the number of outputs switching simultaneously and helps to reduce supply noise. In addition it spreads the noise spectrum out reducing overall EMI.

### Spread Spectrum Clock Generation(SSCG) on the Deserializer

The DS90UB914Q parallel data and clock outputs have programmable SSCG ranges from 10 MHz to 100 MHz. The modulation rate and modulation frequency variation of output spread is controlled through the SSC control registers on the DS90UB914Q device. SSC profiles can be generated using bits [3:0] in register 0x02 in the Deserializer.

## Powerdown

The SER has a PDB input pin to ENABLE or Powerdown (SLEEP) the device. The modes can be controlled by the host and is used to disable the Link to save power when the remote device is not operational. In this mode, if the PDB pin is tied High and the SER will enter SLEEP when the PCLK stops. When the PCLK starts again, the SER will then lock to the valid input PCLK and transmit the data to the DES. In SLEEP mode, the high-speed driver outputs are static (High). The DES has a PDB input pin to ENABLE or Powerdown (SLEEP) the device. This pin can be controlled by the system and is used to disable the DES to save power. An auto mode is also available. In this mode, the PDB pin is tied High and the DES will enter SLEEP when the serial stream stops. When the serial stream starts up again, the DES will lock to the input stream and assert the LOCK pin and output valid data. In SLEEP mode, the Data and PCLK outputs are set by the OSS\_SEL configuration.

## Pixel Clock Edge Select (TRFB / RRFB)

The TRFB/RRFB selects which edge of the Pixel Clock is used. For the SER, this register determines the edge that the data is latched on. If TRFB register is 1, data is latched on the Rising edge of the PCLK. If TRFB register is 0, data is latched on the Falling edge of the PCLK. For the DES, this register determines the edge that the data is strobed on. If RRFB register is 1, data is strobed on the Rising edge of the PCLK. If RRFB register is 0, data is strobed on the falling edge of the PCLK.

**Figure 40. Programmable PCLK Strobe Select**

### Power Up Requirements and PDB Pin

It is required to delay and release the PDB Signal after VDD (VDDn and VDDIO) power supplies have settled to the recommended operating voltage. An external RC network can be connected to the PDB pin to ensure PDB arrives after all the VDD has stabilized.

### Built In Self Test

An optional At-Speed Built In Self Test (BIST) feature supports the testing of the high speed serial link and low-speed back channel. This is useful in the prototype stage, equipment production, and in-system test and also for system diagnostics.

### BIST Configuration and Status

The chipset can be programmed into BIST mode using either pins or registers. By default BIST configuration is controlled through pins. BIST can be configured via registers using BIST Control register (0x24). Pin based configuration is defined as follows:

- BISTEN : Enable the BIST Process
- GPIO0 and GPIO1 : Defines the BIST clock source ( PCLK vs. various frequencies of internal OSC

**Table 10. BIST Configuration**

Deserializer GPIO[0:1]	Oscillator Source	BIST Frequency (MHz)
00	External PCLK	PCLK or External Oscillator
01	Internal	50
10	Internal	25
11	Internal	12.5

The BIST mode provides various options for source PCLK. Using external pins, GPIO0 and GPIO1 or using registers, customer can program the BIST mode to use external PCLK or various OSC frequencies. The BIST status can be monitored real time on PASS pin. For every frame with error(s), PASS pin toggles low for half PCLK period. If two consecutive frames have errors, PCLK will toggle twice to allow counting of frames with errors. Once the BIST is done, the PASS pin reflects the pass/fail status of the last BIST run. The status can also be read through I2C for the number of frames in errors. BIST status on PASS pin remains until it is changed by a new BIST session or a reset. The BIST status on PASS pin is not maintained till RX loses LOCK after BISTEN is de-asserted. To evaluate BIST in the external oscillator mode, both external oscillator and PCLK need to be present.

The BIST status on PASS pin is not maintained till RX loses LOCK after BISTEN is de-asserted. So for all practical purposes, the BIST status can be monitored from register 0x25 i.e. BIST Error Count on the DS90UB914 Deserializer. To evaluate BIST in the external oscillator mode, both external oscillator and PCLK need to be present.

### Sample BIST Sequence

**Step1.** For the DS90UB913/914Q FPD-Link III chipset, BIST Mode is enabled via the BISTEN pin of DS90UB914Q FPD-Link III deserializer. The desired clock source is selected through the GPIO0 and GPIO1 pins as shown in [Table 6](#).

**Step2.** The DS90UB913Q Serializer is woken up through the back channel if it is not already on. The SSO pattern on the data pins is send through the FPD-Link III to the deserializer. Once the serializer and deserializer are in the BIST mode and the deserializer acquires Lock, the PASS pin of the deserializer goes high and BIST starts checking data stream. If an error in the payload is detected the PASS pin will switch low for one half of the clock period. During the BIST test, the PASS output can be monitored and counted to determine the payload error rate.

**Step3.** To stop the BIST mode, the deserializer BISTEN pin is set low. The deserializer stops checking the data. The final test result is not maintained on the PASS pin. To monitor the BIST status, check the BIST Error Count register, 0x25 on the Deserializer.

**Step4.** The link returns to normal operation after the deserializer BISTEN pin is low. [Figure 42](#) shows the waveform diagram of a typical BIST test for two cases. Case 1 is error free, and Case 2 shows one with multiple errors. In most cases, it is difficult to generate errors due to the robustness of the link (differential data transmission etc.), thus they may be introduced by greatly extending the cable length, faulting the interconnect, or by reducing signal condition enhancements (Rx equalization).

Figure 41. AT-Speed BIST System Flow Diagram

Figure 42. BIST Timing Diagram

## APPLICATIONS INFORMATION

### AC COUPLING

The SER/DES supports only AC-coupled interconnects through an integrated DC balanced decoding scheme. External AC coupling capacitors must be placed in series in the FPD-Link III signal path as illustrated in Figure 43.

Figure 43. AC-Coupled Connection

For high-speed FPD-Link III transmissions, the smallest available package should be used for the AC coupling capacitor. This will help minimize degradation of signal quality due to package parasitics. The I/O's require a 100 nF AC coupling capacitors to the line.

### Adaptive Equalizer – Loss Compensation

The adaptive equalizer is designed to compensate for signal degradation due to the differential insertion loss of the interconnect components. There are limits to the amount of loss that can be compensated – these limits are defined by the gain curve of the equalizer. In addition, there is an inherent tolerance for loss defined by the delta between the serializer's minimum VOD and the input threshold (Vswing) of the deserializer. In order to determine the maximum cable reach, other factors that affect signal integrity such as jitter, skew, ISI, crosstalk, etc. need to be taken into consideration. Figure 44 illustrates the maximum allowable interconnect loss with the adaptive equalizer at its maximum gain setting ("914 equalizer gain").

Figure 44. Adaptive Equalizer – Interconnect Loss Compensation

Figure 45 shows the typical connection of a DS90UB913Q Serializer

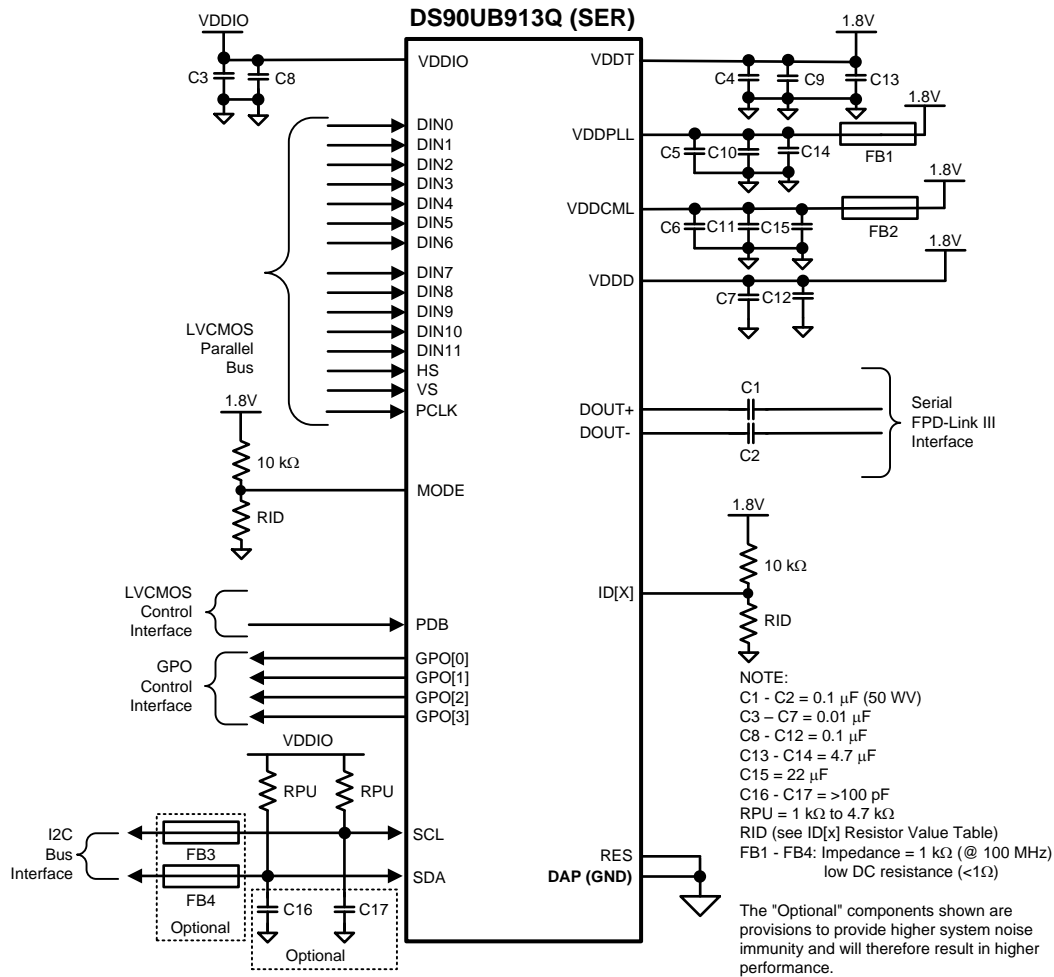

Figure 45. DS90UB913Q Typical Connection Diagram — Pin Control

Figure 46 shows a typical connection of the DS90UB914Q Deserializer.

## PCB LAYOUT AND POWER SYSTEM CONSIDERATIONS

Circuit board layout and stack-up for the Ser/Des devices should be designed to provide low-noise power feed to the device. Good layout practice will also separate high frequency or high-level inputs and outputs to minimize unwanted stray noise pickup, feedback and interference. Power system performance may be greatly improved by using thin dielectrics (2 to 4 mils) for power / ground sandwiches. This arrangement provides plane capacitance for the PCB power system with low-inductance parasitics, which has proven especially effective at high frequencies, and makes the value and placement of external bypass capacitors less critical. External bypass capacitors should include both RF ceramic and tantalum electrolytic types. RF capacitors may use values in the range of 0.01 uF to 0.1 uF. Tantalum capacitors may be in the 2.2 uF to 10 uF range. Voltage rating of the tantalum capacitors should be at least 5X the power supply voltage being used.

Surface mount capacitors are recommended due to their smaller parasitics. When using multiple capacitors per supply pin, locate the smaller value closer to the pin. A large bulk capacitor is recommended at the point of power entry. This is typically in the 50uF to 100uF range and will smooth low frequency switching noise. It is recommended to connect power and ground pins directly to the power and ground planes with bypass capacitors connected to the plane with via on both ends of the capacitor. Connecting power or ground pins to an external bypass capacitor will increase the inductance of the path.

A small body size X7R chip capacitor, such as 0603, is recommended for external bypass. Its small body size reduces the parasitic inductance of the capacitor. The user must pay attention to the resonance frequency of these external bypass capacitors, usually in the range of 20-30 MHz. To provide effective bypassing, multiple capacitors are often used to achieve low impedance between the supply rails over the frequency of interest. At high frequency, it is also a common practice to use two vias from power and ground pins to the planes, reducing the impedance at high frequency.

Some devices provide separate power for different portions of the circuit. This is done to isolate switching noise effects between different sections of the circuit. Separate planes on the PCB are typically not required. Pin Description tables typically provide guidance on which circuit blocks are connected to which power pin pairs. In some cases, an external filter may be used to provide clean power to sensitive circuits such as PLLs.

Use at least a four layer board with a power and ground plane. Locate LVCMOS signals away from the differential lines to prevent coupling from the LVCMOS lines to the differential lines. Closely-coupled differential lines of 100 Ohms are typically recommended for differential interconnect. The closely coupled lines help to ensure that coupled noise will appear as common-mode and thus is rejected by the receivers. The tightly coupled lines will also radiate less.

Information on the WQFN style package is provided in Ti's Application Note: AN-1187 (Literature Number [SN0A401](#)).

## INTERCONNECT GUIDELINES

See AN-1108 (Literature Number [SNLA008](#)) and AN-905 (Literature Number [SNLA035](#)) for full details.

- Use 100Ω coupled differential pairs
- Use the S/2S/3S rule in spacings
  - S = space between the pair
  - 2S = space between pairs
  - 3S = space to LVCMOS signal
- Minimize the number of Vias
- Use differential connectors when operating above 500Mbps line speed
- Maintain balance of the traces
- Minimize skew within the pair

Additional general guidance can be found in the LVDS Owner's Manual - available in PDF format from the Texas Instrument web site at: [www.ti.com/lvds](http://www.ti.com/lvds)

REVISION HISTORY

Changes from Revision B (April 2013) to Revision C	Page
• Changed Falling to Rising in RRFB .....	<a href="#">29</a>
• Changed Rising to Falling in RRFB .....	<a href="#">29</a>
• Changed "PCLK from imager mode" value in DS90UB913Q Serializer MODE Resistor Value table from 0 kΩ to 100 kΩ .....	<a href="#">39</a>
<hr/>	
Changes from Revision A (April 2013) to Revision B	Page
• Changed layout of National Data Sheet to TI format .....	<a href="#">55</a>

## PACKAGING INFORMATION

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
